An index file is separate from a .dbf file. So you must first open a .dbf file and open the corresponding index file(s) if necessary. In to .cdx/.mdx files that open automatically when the corresponding table is opened, you must explicitly open a .ndx/.ntx file using the program's Index Manager dialog box (file->Index manager menu item). Index Index are only relevant to searching in the DBF - you really don't need it (i.e. you read the .dbf database without the index file). However, if you delete the index file, you break the application. With most Clipper/Foxpro features, filter records to limit the records you can access only the data you want using temporary filtering condition. You set a separate filter for each open table.
